MaaMemo — Every Voice Carries a Story

A Voice-First AI-Powered Memory Preservation Platform

The Problem :
Some of our most meaningful memories are shared through conversations with parents, grandparents, and loved ones. These stories carry personal experiences, family traditions, and valuable life lessons, yet many remain unrecorded and gradually fade with time.
Existing digital platforms primarily focus on storing photographs, videos, and written notes. MaaMemo addresses a different aspect of memory preservation: the human voice.

The Solution :
MaaMemo is an AI-powered, voice-first digital memory book that makes preserving personal stories as simple as speaking. Users can record or upload audio memories, convert them into text, organize and revisit saved memories, and listen to them again through AI-generated narration.

The platform aims to transform everyday conversations and personal experiences into a searchable, accessible collection of memories.

Powered by Gnani AI :
Gnani AI's speech technologies form the core of MaaMemo's voice experience:

- **Prisma (Speech-to-Text):** Converts recorded voice memories into readable text, making stories easier to preserve, review, and search.
- **Timbre (Text-to-Speech):** Converts saved memory text into spoken narration, allowing users to listen to their stories again.

By integrating both technologies, MaaMemo creates a two-way voice experience — preserving spoken stories as text and bringing saved memories back to life through audio.

Key Capabilities :

Voice recording and audio upload for capturing memories.
AI-powered speech transcription.
Memory saving, editing, deletion, and search.
AI-generated narration of saved memories.
Original audio playback.
Monthly memory recaps.

Technology Stack
React, JavaScript, Vite, Python, FastAPI, SQLite, SQLAlchemy, Gnani AI Prisma, and Gnani AI Timbre.

Target Users and Potential Impact :
MaaMemo is designed for individuals and families who want to preserve personal experiences, particularly stories shared across generations. It can help families maintain a digital collection of voices and experiences that can be revisited and shared over time.
Beyond personal memory preservation, the concept has potential applications in oral history documentation, family storytelling, and preserving cultural experiences.

Future Scope :
Potential enhancements include multilingual transcription and narration, shared family memory collections, persistent cloud storage, and interactive voice-based search across saved memories.

The Vision :
MaaMemo is built on a simple belief: technology should not only help us store information, but also preserve the human experiences behind it.

Because every voice carries a story worth remembering. 🩶
